

## ANOVA HEALTH CLINICAL PEARL BULLETIN

## 11-08-2010 - ARGENTYN 23

## *Is it possible to have a phenomenal product and yet have it fail to produce desired results?*

Yes, especially if delivery and dosing protocols are not followed. This has always been one of the challenges in achieving great results in nutritional practices. In many cases it is a lack of compliance by patients which illustrates the need for clear and consistent communications.

In my conversations with practitioners, I have discovered that they believe strongly that Argentyn 23 has been a phenomenal product for clearing sinuses and sore throats and a variety of skin problems. When it comes to working on deeper issues there has not always been the belief or success that I have achieved and know is possible for a large majority of cases.

## The reason: A lack of proper dosing protocols.

The reasons for this seem to be twofold:

- 1. It is difficult to put the enclosed dosing protocol information on a label for everyone to reference.
- 2. A fear that silver is a toxic metal at higher levels of ingestion. This is not true with a true hydrosol like Argentyn 23.

So let's clear the air. Many silvers are poorly made and have impurities or are bound to mineral salts or proteins that can cause dermal issues over time to retain large amounts of silver. Also, the lack of effectiveness of impure silver is due to much larger particle size.

*Size, dispersion and purity make Argentyn 23* the only speciation of this type. I can prove this through monograph studies. I address these issues to drive home the fact that proper dosing protocols are paramount to get maximum results.

Argentyn 23 is a speciation of silver that is never toxic and can be used in large quantities with no adverse effects but with *great effectiveness*. In order to work with intestinal issues and tough viral issues it is imperative that you know that silver has a half life in the lymphatic system of 15 minutes. *In order to continually reduce an overgrown microbial infestation requires continual dosing every fifteen minutes for 3-5 hours to eventually eradicate the infection.* 

The recommended dosage every 15 minutes is 1 tsp for a 100 lb. individual and an additional teaspoon for each additional 40 lbs. So for a 180 lb. man this would be 3 tsp. every 15 minutes for 3-5 hours.

Yes, this means that an individual may need one or more 8 or 16 ounce bottle(s) per occurrence.

The above mentioned dosage causes a *continued die off* of the infectious agent *WITHOUT* that organism being given ample time to repopulate. So in effect, the goal is to continue to kill the organism faster than it can repopulate. *We want to saturate the lymphatic system and keep it saturated until we are finished with the immune challenge.* 

The cost to do this is a bargain. If I told you I could eliminate your new nasty flu bug in a few hours for \$50-\$90 would that really be a bad deal? People are spending way more than that for antibiotics that may never eradicate their bacterial load before a new resistant strain appears. I tell patients if they complain about the cost that "it's their challenge and this is what it will take". If they have a better solution I am open to seeing it. There is none. Where is there a more effective therapy across the board for viruses than Argentyn 23?

The bottom line is that there are clinics that are *highly effective in dealing with deep viral and fungal issues* because they apply the necessary protocols. Many of the most successful offices are medical offices that follow through on accepted dosing protocols in lieu of muscle testing. While I have nothing against muscle testing there are times it fails because of other questions that need to be included in the query.

Please realize that what I am recommending will take a supply of larger bottles and the time to explain to the patient as to what is needed. For some practitioners, it will take a new mindset as to what Argentyn 23 really can do and that it really is a safe product.

Please call me if you have not seen the article on the *safety of Argentyn 23* from Dr. Dana Flavin, M.D. who is a former toxicologist at the FDA. We also have studies on the kill rates of Argentyn 23 versus the other major brands of silver. Argentyn is a clear winner in kill rates and is in GLASS bottles. Silver contained in plastic bottles is an absolute NO NO due to the leaching of various endocrine disruptors.

I hope this further clarification helps you, your staff and your patients in what is already promising to be an active flu season. Argentyn 23 is also highly recommended for all types of chronic viral immune challenges from herpes to lymes. Please feel free to call me if you have any questions.

If you desire the finest in immune modulators that is also recommended for any infection or difficult immune challenge ask me for information on our line of exceptional products from BioPreventics Research.

Now is the time to make sure your pharmacy is well stocked to be ready and highly successful in this coming flu season.

Warmest regards,

Frank A. Charles, ND (828) 337-8304 cell drcharles@anovahealth.com
