

IMPOTENCE

Impotence, now more commonly known by the re-branded marketing term ‘erectile dysfunction,’ may indeed be becoming more prevalent in parallel to the rise of diabetes and cardiovascular disease. While sexual arousal is a complex psychological and neuro-endocrine function, penile tumescence remains an essentially vascular process. Impotence is defined as the inability to attain or sustain an erection adequate for sexual intercourse. The cause may be and often is entirely psychological, a good clue for establishing this is the presence of spontaneous nocturnal erections despite difficulties with a partner. Other potential causes may include hypogonadism, cardiovascular disease, Peyronie’s disease, neurological disease, and depression. Obesity can contribute through its combined adverse effects on testosterone levels and cardiovascular function, and some drugs including the SSRIs can interfere with sexual function. It should be noted that the inability to attain adequate erections is not a normal consequence of aging.

Homeopathics

Androstat™- homeopathic detoxifier for the male genital organs, indicated for relief of pain of the lower abdomen, discharge from the urethra, and difficult urination.**
